

S. Ohno Evolution by Gene Duplication

Springer-Verlag

New York · Heidelberg · Berlin

Contents

Introduction	1
References	2

Part 1

The Creation of Life Based on the Inherent Complementarity between Purine and Pyrimidine Bases

Chapter I. Perpetuation of the Germ Line	3
References	4
Chapter II. Replication of Nucleic Acids on the Basis of A-T, G-C Complementarity and the Origin of Life.....	4
1. The Presence of Self-replicating Nucleic Acids in "Prebiotic" Condition	6
2. Emergence of <i>Transfer</i> RNA	7
3. Division of Labor between DNA and RNA	12
4. Emergence of Ribosomes	13
References	14
Chapter III. Chromosomes of Eukaryotes	15
1. Centromere	16
2. Nucleolar Organizer.....	17
3. Heterochromatic Region	17
4. Further Need for Untranscribable Base Sequences	18
5. Histones as Nonspecific Repressors of Transcription	18
References	20

Part 2

Mutation and the Conservative Nature of Natural Selection

Chapter IV. Mutation as a Change in the Base Sequence of a DNA Cistron .	21
1. Mutations Affecting Structural Cistrons	21
a) <i>Frame-shift</i> Mutations	21
b) <i>Nonsense</i> Mutations	22
c) <i>Missense</i> Mutations	22
d) <i>Samesense</i> Mutations	23
2. Mutations Affecting <i>Transfer</i> RNA Cistrons	24
a) <i>Suppressor</i> Mutation	24
b) Mutations which Result in Ambiguous Coding	25
References	26
Chapter V. <i>Forbidden</i> Mutations	26
1. <i>Forbidden</i> Mutations Affecting <i>Transfer</i> RNA Cistrons	26
2. <i>Forbidden</i> Mutations of Structural Cistrons	27
3. <i>Forbidden</i> Mutations Favored	30
References	31
Chapter VI. <i>Tolerable</i> Mutations	32
1. <i>Neutral</i> Mutations	32
2. <i>Favored</i> Mutations	35
3. Convergent Evolution and Recurrent Mutations	37
4. Atavism and Revertant Mutations	38
References	40
Chapter VII. The Conservative Nature of Chromosomal Evolution	41
1. The Absence of a Close Linkage Requirement for Functionally Related Genes	41
2. Inversion as an Internal Rearrangement	42
3. Robertsonian Fusion: The Creation of One Metacentric by Fusion of Two Acrocentrics	43
4. The Creation of a Sterility Barrier by Chromosomal Changes	44
5. Conservation of the Original Linkage Groups	45
References	46
Chapter VIII. The Spontaneous Mutation Rate	48
1. <i>Forbidden</i> Mutations Versus <i>Tolerable</i> Mutations	48
2. The Mutation Rate and Cistron Size	49
3. Intragenic Recombination and the Principle of Polymorphism Generating More Polymorphism	50
4. On the So-called Living Fossils	53
References	54

Chapter IX. The Rate of Evolution and the Importance of Isolation	55
1. Isolation as a Prerequisite for Speciation	56
2. Population Size and the Price of Success	57
3. Generation Time and the Rate of Evolution	57
References	58

Part 3

Why Gene Duplication?

Chapter X. Duplication for the Sake of Producing More of the Same	59
1. Genes for <i>Ribosomal</i> RNA	60
2. Genes for <i>Transfer</i> RNA	61
3. Inherent Disadvantage of Having Multiple Copies of the Same Gene ..	62
References	65
Chapter XI. The Attainment of a Permanent Heterozygous Advantage by the Incorporation of Two Former Alleles into the Genome	65
References	67
Chapter XII. The Differential Regulation of Former Alleles and Their Trans- formation to Isozyme Genes	67
References	71
Chapter XIII. The Creation of a New Gene from a Redundant Duplicate of an Old Gene	71
1. The Case of Trypsin and Chymotrypsin	72
2. The Protein of Microtubules and Actin of the Skeletal Muscle	74
3. Myoglobin and Hemoglobin	76
4. L- and H-chains of Immunoglobulin	77
5. The Emergence of a New Gene by a <i>Frame-shift</i> Mutation	80
References	80
Chapter XIV. Duplication of Regulatory Genes and Receptors	82
1. Hierarchy of Regulatory Mechanisms	83
2. The Requirements to be a Regulator of Gene Activation	84
3. Concordant Duplication of a Primary Regulatory Gene and a Structural Gene	85
4. Morphological Changes Due to Functional Diversification of a Dupli- cated Regulatory Gene	86
5. Duplication of <i>Receptor</i> Sites Adjacent to Structural Genes	87
References	87

Part 4**Mechanisms of Gene Duplication**

Chapter XV. Tandem Duplication Involving Part of One Linkage Group at a Time	89
1. Unequal Exchange between Two Chromatids of the Same Chromosome	89
2. Unequal Crossing-over between Two Homologous Chromosomes during Meiosis	92
3. Regional Redundant Replication of DNA	92
4. Merits and Shortcomings of Regional Duplication	94
References	97
Chapter XVI. Polyploidy: Duplication of the Entire Genome	98
1. Incompatibility between Polyploidy and the Well Established Chromosomal Sex Determining Mechanism	98
2. Autopolyploidy	99
3. Allopolyploidy	100
4. Diploidization of the Tetraploid	101
5. Elimination of Certain Chromosomes during Diploidization	104
6. Dosage Effect of Regulatory Genes in the Tetraploid	104
References	105
Chapter XVII. Other Mechanisms for Achieving Gene Duplication	107
1. Polysomy	107
2. Incorporation of Supernumerary Chromosomes	107
3. Lysogeny: Incorporation of the Viral Genome	108
4. Viral Transduction	109
References	109

Part 5**Evolution of Vertebrate Genomes**

Chapter XVIII. Primitives Inherit the Earth	111
1. Emergence of the First Vertebrates	111
2. The Type of Fish which were Prepared to Become Land Living Animals	113
3. Evolution from Fish to Amphibians	115
4. The Invention of the Amniote Egg and the Emergence of Reptiles and Birds	116
5. <i>Synapsida</i> and the Emergence of Mammals	118
6. Mammals in General	120
7. Primates and Man	121
References	123

Chapter XIX. Nature's Great Experiment with Gene Duplication during Evolution from Tunicate-like Creatures to Fish	124
1. The Genome Size of Tunicate-like Creatures from which Vertebrates Emerged	124
2. Extreme Diversity of Genome Size Exhibited by Fish	125
a) Changes in Genome Size which are Due Exclusively to Tandem Duplication	128
b) Meaninglessness of Exclusive Dependence upon Tandem Duplication	128
c) Efficacy of Tetraploidy as a Means of Acquiring Functionally Diversified Duplicated Genes	130
d) Possible Polyphyletic Origin of Terrestrial Vertebrates	130
References	131
Chapter XX. Evolution from Amphibians to Birds and Mammals and the Abrupt Cessation of Nature's Experiment at the Reptilian Stage	132
1. Frogs <i>Versus</i> Salamanders	132
2. Diapsidian Reptiles and Birds	134
3. <i>Synapsida</i> Line of Reptiles	136
4. Mammals	137
References	138
Chapter XXI. Whence Comes Man?	139
1. Uniformity of the Genome Size and the Number of Duplicated Gene Loci	139
2. Was Diversification of Placental Mammals Due Strictly to Allelic Mutations of the Already Existing Gene Loci?	141
3. An Evolutional Mechanism which Anticipated Future Needs	142
References	145
Subject Index	147
Plates I-VIII	151
